

Topic: SQL – User Management, Views

Solve the following exercises using the sakila database.

Part I – User Management

1. Create a user named *user_leitura* and another named *analista* that can only connect to the MySQL server from *localhost*, and set their passwords to *1234*.
2. Modify *user_leitura* to define a new, more secure password and set the password to expire after 90 days.
3. Write an SQL statement that lists all existing users in the MySQL system.

Part II – Roles

4. Create two roles named *leitor* and *editor*.
5. Assign the *leitor* role to the *user_leitura* user.

Part III – Permissions

6. Grant read permissions on the entire sakila database to the *leitor* role.
7. Grant the *editor* role read, insert, and update permissions only on the *customer* and *rental* tables.
8. Assign the *editor* role to the *analista* user.
9. Set the *editor* role as the default active role for the *analista* user.
10. Remove the update permission from the *editor* role, ensuring it can no longer modify data in the *customer* table.

Part IV – Views

11. Create a view named *vw_clientes* that displays the customer ID, first name, last name, and email from the *customer* table.
12. Create a view named *vw_filmes* that displays the film title and its respective category using the necessary tables.
13. Create a view named *vw_rentals_ativos* that shows all rentals that have not yet been returned.
14. Create a view named *vw_top_clientes* that displays the customer ID, name, and total number of rentals made, ordered from highest to lowest.
15. Create a role named *relatorio* and grant it read permissions only on the *vw_clientes* view. Then assign this role to the *viewer* user.
